

The OxyJet system can increase DO levels to over 20 ppm throughout the pond down to the sediment layer where it is needed most.

Oxygen is generated on-site and pumped into a specially designed water-oxygen contact chamber. Here, pumped pond water becomes super-saturated with oxygen and diffuses throughout the pond.

This technology has distinct advantages over other aeration including being able to reach much higher DO levels, having low visual and audible impact, as well as being simple to install.

- **Increase DO throughout entire water column**
- **Improve pond health**
- **Improve turf health**
- **No unsightly splashing**
- **Reduce algae growth**
